

az aks command invoke

- Represents an az AKS command used to invoke commands like kubectl or helm through the Azure API without directly connecting to the cluster
- To run “az aks command invoke”, the following roles are required:
 - Microsoft.ContainerService/managedClusters/runcommand/action
 - Microsoft.ContainerService/managedclusters/commandResults/read
- “az aks command invoke” generates the creation of a “command-<ID>” pod in aks-command namespace to access the AKS cluster and retrieve the required information
- 200 ranges can be added
- Usable with any kind of cluster
