

Arrays: Java

Index

An index refers to an element's position within an array. The index of an array starts from 0 and goes up to one less than the total length of the array.

```
int[] marks = {50, 55, 60, 70, 80};

System.out.println(marks[0]);
// Output: 50

System.out.println(marks[4]);
// Output: 80
```

Arrays

In Java, an array is used to store a list of elements of the same datatype.

Arrays are fixed in size and their elements are ordered.

```
// Create an array of 5 int elements
int[] marks = {10, 20, 30, 40, 50};
```

Array creation in Java

In Java, an array can be created in the following ways:

- Using the `{ }` notation, by adding each element all at once.
- Using the `new` keyword, and assigning each position of the array individually.

```
int[] age = {20, 21, 30};

int[] marks = new int[3];
marks[0] = 50;
marks[1] = 70;
marks[2] = 93;
```

Changing an Element Value

To change an element value, select the element via its index and use the assignment operator to set a new value.

```
int[] nums = {1, 2, 0, 4};  
// Change value at index 2  
nums[2] = 3;
```
