

Azure Monitor with Container Insights

- **Container Insights** is a **monitoring solution** provided by Azure Monitor for AKS clusters (and others)
- It enables users to **collect, view, and analyze container logs, metrics, and telemetry data** from all the **containers** running in their AKS clusters
- With Container Insights, users can quickly **troubleshoot issues** by drilling down into container logs and performance metrics **at the node, controller, and container level**
- It provides **out-of-the-box dashboards** for key metrics such as container CPU and memory utilization
- AKS provides a managed **add-on named “monitoring”** for enabling Container Insights
- This solution **requires a Log Analytics Workspace** 
- The Azure **Log Analytics Workspace** is a consolidated area for **gathering, storing, and analyzing log** data from diverse sources
- It offers **advanced querying options and visualizations** to assist consumers in understanding their data and handle the situation
- After enabling “monitoring” add-on, an agent called **Azure Monitoring Agent (AMA)** gets deployed in the cluster which **collects monitoring data from the guest operating system**
