

Diagnostic settings in AKS

- Azure Monitor's **diagnostic settings** feature **enables the collection and routing of diagnostic data** to different locations, such as storage accounts, event hubs, and log analytics workspaces
- The diagnostic settings feature **allows you to choose what diagnostic data to gather**, how to gather it, and where to deliver it for storage and analysis
- **In AKS**, you can configure diagnostic settings to include data from **control plane components** like:
 - API Server
 - Controller Manager
 - Cloud Controller Manager
 - Scheduler
 - Cluster Autoscaler
 - Others
 - Kube-Audit
 - Represents a chronological set of records detailing events in the cluster
 - Capture activity from Kubernetes API-using applications, the control plane, and users
