

Monitoring AKS with managed Prometheus and Grafana

- **Prometheus** is a popular **open-source** metric **monitoring solution** for Kubernetes clusters
- Azure Monitor provides a **managed service for Prometheus**, allowing you to monitor workloads and infrastructure performance at scale using the Prometheus query language (PromQL)
- **Platform and custom metrics** share common aspects with Prometheus metrics, but different features are used to better **complement** open-source tools like **Grafana**
- To use Azure Monitor **managed service for Prometheus**, you need to **enable** the **AzureMonitorMetrics** addon
- **Enabling** the **AzureMonitorMetrics** **addon** requires:
 - **Azure Monitor Workspace**: different from the Log Analytics Workspace and **enables the Managed Prometheus**
 - **Azure Managed Grafana** instance: a **platform for data visualization for Grafana** managed by Azure on top of the Grafana software
 - The **Azure Monitor Workspace** and **Azure Managed Grafana** resource **need to be linked** to **view** the **Prometheus data** in the **Grafana dashboard**
