

General information about TCPDump

- **TCPDump** is a command-line **packet analyzer** used for **capturing and analyzing network traffic**
- It **displays detailed information** about each packet including source/destination IP, protocol type, packet size, and timestamp
- TCPDump is **useful for network troubleshooting**, security analysis, and debugging network applications. It offers real-time inspection, packet filtering, and saving to a file for later analysis

How to decide at which level (node or pod) to capture the TCPDump

- Capture TCPDump on **node** for issues related to traffic not reaching node or blocked by firewall
- Capture TCPDump on **pod** for issues related to traffic between pods within the cluster
- At node level, **more data** is captured
- It is recommended to take captures at **both, source and destination**
- **Reproduce the issue** while the TCPDump captures traffic

How to analyze a TCPDump

- TCPdump files can be opened as **text**, but **contents may not be easily readable**
- **Wireshark** is a tool used to **analyze TCPDump files**, providing a user-friendly interface to inspect and filter network packets
- Others
