

What is Azure Container Registry (ACR) and how the integration works?

- ACR is a private and secure registry for storing and managing container images and artifacts
- ACR has features such as geo-replication, secure authentication and access control, image scanning, and integration with other Azure services

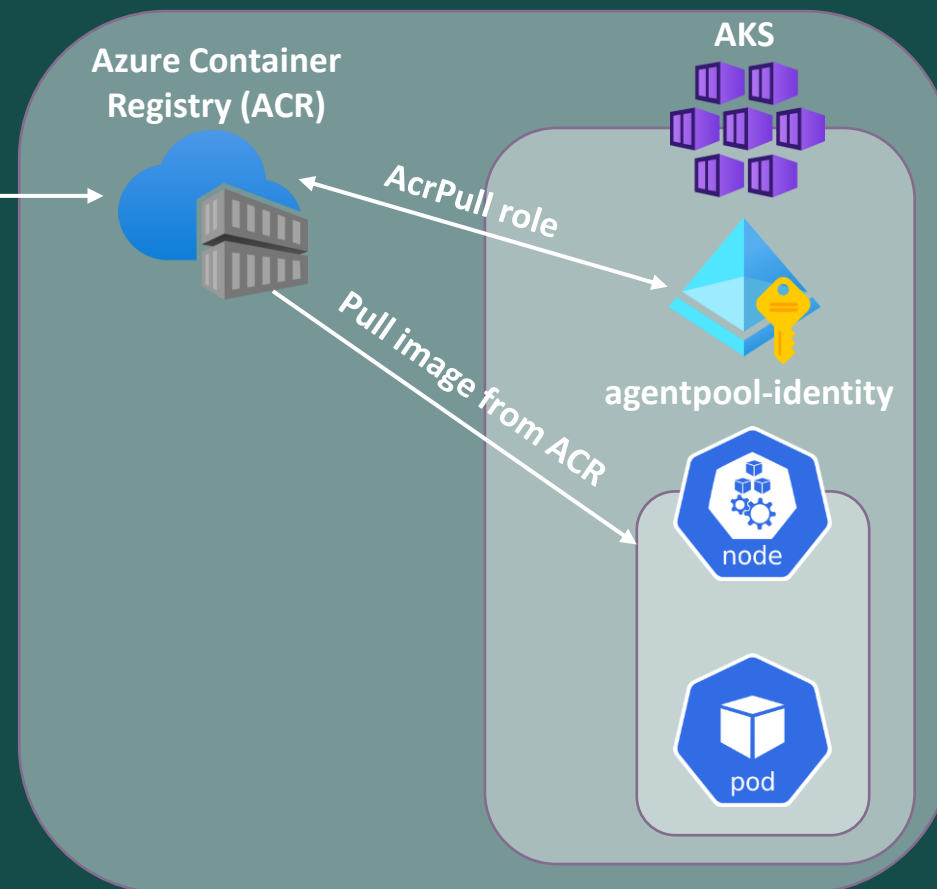

Azure / RBAC method

- `--attach-acr <acrname/resourceid>`
- AcrPull role at ACR level for AKSs' agentpool-identity

What is Azure Container Registry (ACR) and how the integration works?

- ACR is a private and secure registry for storing and managing container images and artifacts
- ACR has features such as geo-replication, secure authentication and access control, image scanning, and integration with other Azure services

Kubernetes / pull secret method

- docker-registry type secret referencing ACRs' admin credentials
- Kubernetes objects like pods, deployments, etc., will need to reference that secret in the manifest using “imagePullSecrets” field
