

API server authorized IP ranges

- Everyone has networking connectivity to the IP of an API server of a public AKS clusters
- The API server authorized IP ranges feature will allow you to enable ranges that are allowed to connect to the API server. If the request will not come from one of that ranges, it will be blocked
- When you enable API server authorized IP ranges feature the outbound public IP for the cluster's Standard load balancer is also enabled by default
 - Add 0.0.0.0/32 to allow only the public IP of the Standard load balancer
- 200 ranges can be added
- Feature available only for public AKS clusters
- If you use nodes with public IPs, the node pools must use public IP prefixes which need to be added as authorized ranges
