

Availability Zones (AZs) in AKS

- **Availability zone: a physically separate and independent data center within a region**
- **Each availability zone** contains **own** power, networking, and cooling systems
- Using AZs can **protect from failures**, including hardware, network, and natural disasters
- Replicating resources across AZs **ensures applications remain available and responsive**

AKS specifics

- **To use AZs in AKS**, define **during** cluster or node pool **creation**
- When **using disks** note:
 - **Locally Redundant Storage (LRS) disks** are not zone redundant and **cannot be attached across zones**
 - **Zone Redundant Storage (ZRS)** disks can be **used by nodes that are using zones or even non-zone nodes**
