

Azure Key Vault Provider for Secrets Store CSI Driver

- Applications in Kubernetes may need to access sensitive data stored in Kubernetes Secrets
- Managing and securing these secrets can be complex and error-prone, and their values are encoded with base64, not encrypted
- Azure Key Vault is a cloud-based service for storing and managing secrets, keys, and certificates, offering a secure mechanism to manage these secrets
- The Azure Key Vault Provider for Secrets Store CSI Driver allows Kubernetes to securely access secrets stored in Azure Key Vault, without the need to maintain them directly
- Using the CSI driver makes managing and rotating secrets easier, and reduces the risk of secrets being misused or disclosed
- AKS provides a managed add-on for this solution: azure-keyvault-secrets-provider
- SecretProviderClass is used to specify how AKS connects to Azure Key Vault
