

Azure Policy in AKS

- Azure Policy is a service to define, assign, and manage policies for Azure resources, which can be applied across multiple Azure subscriptions to manage resources, enforce security and governance, and ensure regulatory compliance
- An analogy to real-world scenario can be a company with restricted entry where security badges are used to ensure unwanted access is prevented by having a set of guidelines for the badges
- Similarly, Azure Policy establishes guidelines for resources, such as AKS clusters, to ensure resources are configured consistently for security, compliance, and cost management, leading to cost efficiency, regulatory compliance, and security breach prevention
- AKS provides a managed add-on to simplify integration of Azure Policy
- Azure Policy expands Gatekeeper, an admission controller webhook for Open Policy Agent (OPA), to deploy at-scale enforcements and protections in a centralized, uniform manner
- Azure provides a list of built-in policies, but you can also build custom policies using the REGO language
