

Certificates in AKS

- Certificates are used to establish secure communication between components within a cluster, and to authenticate and authorize access to the API server
- Issued by a certificate authority (CA)
 - AKS API server created a CA called the Cluster CA
 - For AKS clusters created after May 2022, Cluster CA certificates expire after 30 years
- AKS auto-rotates the certificates by default for AKS clusters with RBAC enabled
- You can manually rotate the certificates with:
`az aks rotate-certs -g $RESOURCE_GROUP_NAME -n $CLUSTER_NAME`
