

Use Image Cleaner (Eraser) in AKS

- Image Cleaner **automates the identification and removal of stale images**
- Image Cleaner is **based on** the open-source project called **Eraser**
- The associated **Pods** and other **Kubernetes objects** include “**eraser**” in their **names**

Use Image Cleaner (Eraser) in AKS

Use Image Cleaner (Eraser) in AKS

- Image Cleaner removes **only vulnerable non-running images**

How the image cleaner is different from Kubernetes garbage collection?

- The default garbage collection is based on disk usage
- Image Cleaner offers a few key advantages
 - Can utilize image vulnerability data to determine which images should be removed
 - The image cleaner can clean up images that are not managed by Kubelet and Kubernetes
- The Image Cleaner can be enabled during cluster creation or even after with the help of the “**--enable-image-cleaner**” parameter
- “**--image-cleaner-interval-hours**” parameter can be configured to specify when the Image Cleaner should act
 - Interval hours range: [24 - 2160]
 - Default value: 168 hours
- “**--disable-image-cleaner**” can be used to disable Image Cleaner
